MuleSoft · Anypoint Platform

INTEGRATION ARCHITECTURE REVIEW

Example Co

How the MuleSoft estate is built, how it is used, and where the next gains in API reuse will come from.

197
applications running

62%
on CloudHub 2.0

97
production integration flows

57%
production reuse rate

Based on the Anypoint Platform network-graph export of 13 November 2026 · 4 business groups · 6 active environments

AT A GLANCE

Executive summary

What's working well

- ✓ **Production is largely healthy**: 46 of 47 production deployments are running.
- ✓ **Reuse is ahead of peers**: a 56.8% production reuse rate against a 47.9% peer average (Mature API-led stage).
- ✓ **Shared services are in place**: 20 APIs are called by two or more components, led by sys-customer-master-v1.
- ✓ **A clear API-led structure**: 38 of 44 production apps follow the Experience / Process / System pattern.

Where the next gains are

- → **Retire what isn't used.** 27 stopped applications could be decommissioned.
- → **Protect shared APIs.** 6 production APIs used by 3+ consumers run on a single replica.
- → **Review isolated apps.** 3 production apps have no mapped dependencies.
- → **Bring more apps into the API-led pattern.** 6 production apps sit outside the Experience / Process / System layers.

SUGGESTED GOAL Keep the reuse rate above **55%** while simplifying: retire superseded or unused APIs and lift reusability (the share of APIs with more than one consumer) from 65.7%.

224	6	38	21
Deployments	**Active environments**	**Layered APIs**	**Backend systems**
197 running · 27 stopped		8 Exp · 12 Proc · 18 Sys	

Data confidence: **High**. Client applications are pre-aggregated by Anypoint; per-application consumption is inferred from group counts.

97
Production flows

21
Backend systems

27.7
vCores in use
12.6 in production

Applications by environment

Values show running / total and the vCores (vC) in use.

Production health

46 of 47 production applications are running. Some production environments have stopped apps to review.

Where stopped apps sit

27 of 224 deployments are stopped, mostly in Development.

Capacity

27.7 vCores are in use, 12.6 of them in production.

4 business groups

Applications, operational health and API-led layer mix for each Anypoint business group, across all environments.

Core Platform

20 prod · 77 sandbox

Applications **88 running / 97**

Layer mix Exp 0 · Proc 33 · Sys 44 · Other 20

Shared Services

16 prod · 53 sandbox

Applications **62 running / 69**

Layer mix Exp 8 · Proc 19 · Sys 31 · Other 11

Digital Channels

10 prod · 35 sandbox

Applications **40 running / 45**

Layer mix Exp 30 · Proc 5 · Sys 10 · Other 0

Example Co

1 prod · 12 sandbox

Applications **7 running / 13**

Layer mix Exp 0 · Proc 0 · Sys 0 · Other 13

Core Platform is the largest group

97 deployments, 88 running.

Core Platform leads on API-led

77 of its 97 deployments sit in the three API layers.

Where the clean-up is

Core Platform has the most stopped deployments (9 of 97).

The three-layer view

Experience APIs serve channels and partners, Process APIs orchestrate, and System APIs connect the systems of record. A badge shows how many other components call that API.

Experience 8 APIs	exp-customer-portal-v1 · exp-mobile-app-v1 · exp-partner-gateway-v1 (2) · exp-partner-gateway-v2 · exp-employee-portal-v1 · exp-public-website-v1 (2) · exp-self-service-v1 (2) · exp-reporting-v1
Process 12 APIs	prc-customer-management-v1 (2) · prc-order-orchestration-v1 (3) · prc-case-management-v1 · prc-account-services-v1 (2) · prc-document-services-v1 · prc-invoice-processing-v1 · prc-identity-verification-v1 · prc-notification-routing-v1 (2) · prc-employee-onboarding-v1 · prc-search-aggregation-v1 (2) · prc-supplier-management-v1 · prc-payment-processing-v1
System 18 APIs	sys-crm-v1 (2) · sys-erp-v1 (4) · sys-hr-v1 · sys-itsm-v1 · sys-identity-v1 (3) · sys-documents-v1 (2) · sys-file-storage-v1 · sys-core-database-v1 (2) · sys-messaging-v1 (2) · sys-email-v1 (2) · sys-payments-v1 (2) · sys-code-lists-v1 · sys-address-lookup-v1 (3) · sys-file-transfer-v1 · sys-search-index-v1 · sys-finance-ledger-v1 (4) · sys-customer-master-v1 (5) · sys-audit-logging-v1 (3)
Integration & batch 6 apps	batch-invoice-export · batch-data-warehouse-sync · sched-reference-data-refresh · listener-order-events · batch-supplier-feed · sync-employee-directory

Integration & batch apps sit outside the Experience / Process / System naming pattern; nothing calls them. Between them they reach 7 backend systems directly and call Mule APIs 6 times.

The System layer is the widest

18 System APIs, against 8 Experience, 12 Process.

Shared building blocks

sys-customer-master-v1 (5 callers), sys-erp-v1 (4 callers) are the most-called System APIs.

How much follows the pattern

38 of 44 production apps sit in a clear layer; 6 are integration or batch apps.

How the estate is used

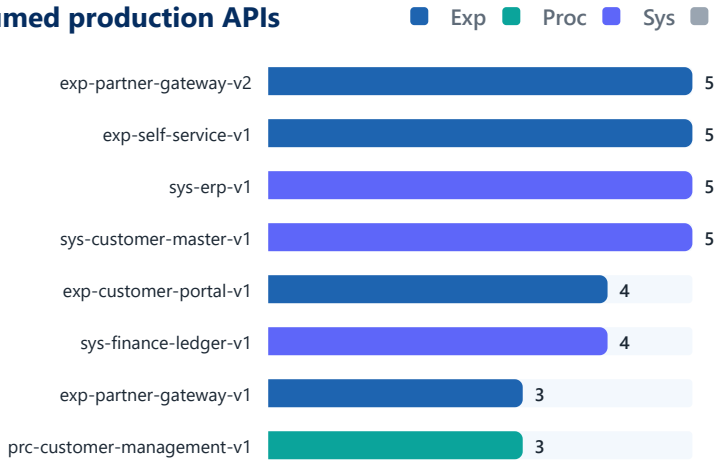

97
Unique production flows
103 raw connections

21
Registered client apps

44
Production Mule apps

9
APIs with no consumers

Most-consumed production APIs

Number of consumers: client applications plus calling APIs.

Where demand concentrates

The four most-consumed APIs carry 25% of all 81 consumers, led by exp-partner-gateway-v2 (5).

Managed consumers

21 client applications are registered in API Manager. Managed contracts add visibility, SLAs and measurable reuse.

Unidentified inbound traffic

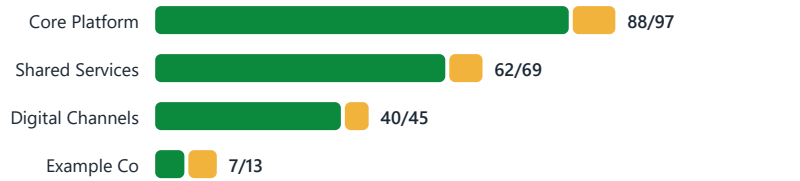

"External Traffic" stands for callers without a recognised client ID; it calls 3 APIs. Registering these callers in API Manager would make them visible.

APIs with no traffic

1 production app had no observed calls in the period. They may be new or low-volume, and are worth confirming.

224 deployments across 4 business groups

Deployments by business group

Runtime platform

Runtime platform

140 of 224 deployments run on CloudHub 2.0; 84 remain on CloudHub 1.0.

Stopped applications

27 deployments are stopped, most in Core Platform (9). A clean-up sprint would simplify governance.

3 isolated production apps

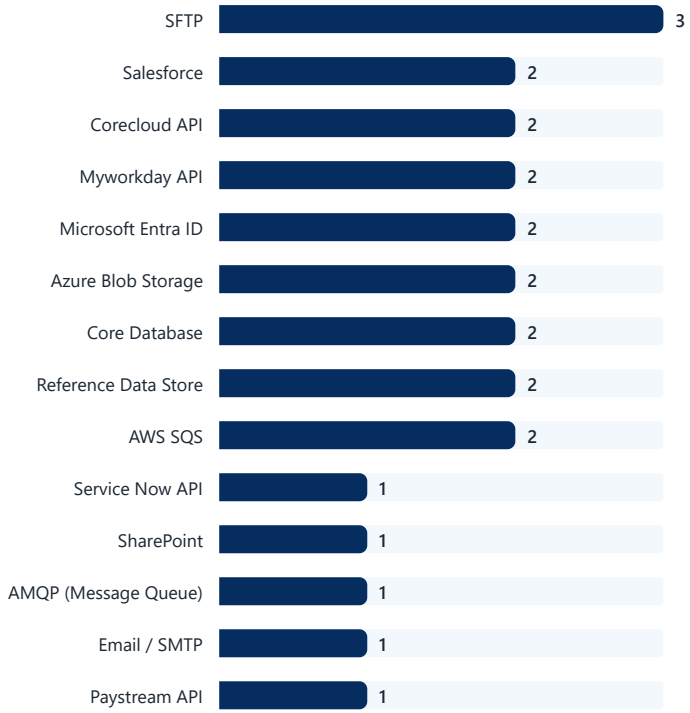

44 of 47 production apps appear in the dependency graph. The other 3 (exp-campaign-microsite-v1, legacy-report-scheduler, test-connectivity-check-prod) have no mapped dependencies.

Platform health

20 of 46 production apps run on one replica, including 6 shared by 3+ consumers (led by sys-customer-master-v1, 5). An outage there affects every caller. 5 of 44 production apps still run on Java 8. Test apps in production: test-connectivity-check-prod.

21 systems of record and partners

Connections per backend system

Number of production integration flows that end at each system (top 14 of 21).

SFTP is the most-connected system

3 production flows end at SFTP, followed by Salesforce (2).

The systems behind the APIs

External System / Partner: 13, Cloud Service: 3, Messaging / Email: 2, File Transfer: 1.

Single-connection systems

12 systems have a single connection. If other teams need the same data, these are candidates for shared System APIs.

Observations and recommendations

Peer-review metrics

the MuleSoft peer-review deck framing, for like-for-like comparison

API-led **79.5%** (35 of 44 Mule apps have a consumer) · Reuse rate **55.7%** (44 of 79 consumers are reuse) · Reusability **60.5%** (23 of 38 API-led APIs have 2+ consumers). These count only Experience, Process and System APIs, so they differ from the Reuse Analysis figures.

Most-reused services

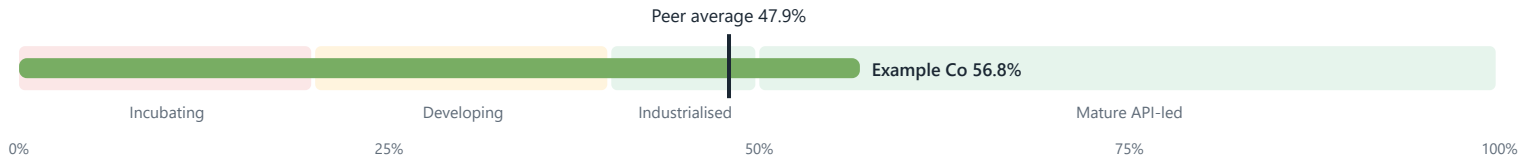

Number of distinct components calling each API (top 10 of 20).

1. **Decommission unused applications.** Review the 27 stopped deployments, starting with proofs of concept and test projects.
2. **Promote the shared System APIs.** Publish sys-customer-master-v1, sys-erp-v1, sys-finance-ledger-v1 in Exchange with clear documentation and SLAs.
3. **Add a second replica to shared APIs.** 6 production APIs are used by 3 or more consumers but run on one replica, led by sys-customer-master-v1 (5 consumers).
4. **Manage consumers through API Manager.** Only 11 of 38 APIs (29%) are consumed by registered client apps. Register clients and contracts.
5. **Identify unregistered callers.** Traffic shown as "External Traffic" has no recognised client ID. Registering these callers adds visibility and policy control.
6. **Extend API-led delivery.** 6 production apps sit outside the API layers. New builds should reuse existing System APIs rather than connect point-to-point.

Production reuse

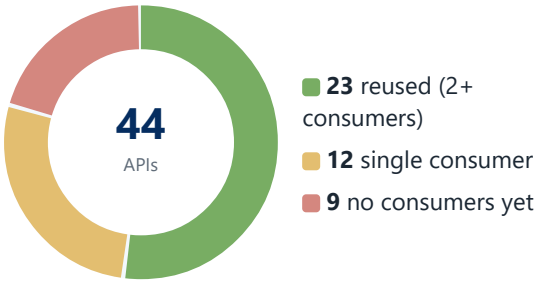

56.8%	65.7%	2.31	81	44	Mature
Reuse rate	Reusability	Reuse index consumers per active API	Total consumers 46 reuse instances	APIs analysed	Maturity stage the highest stage (50%+)

Example Co against comparable customers

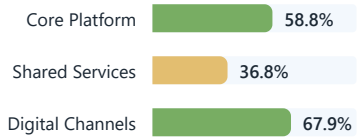

Peer average from comparable MuleSoft customers.

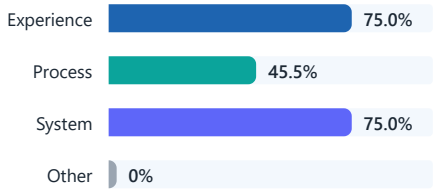

How production APIs are consumed

Reuse rate by business group

Reuse rate by API layer

THE OPPORTUNITY Example Co is above the peer average. The next gain is reuse inside the platform: Process-layer reuse is 45%, the lowest of the three layers, and reusability is 65.7%.

NEXT STEPS

Turning the platform into reuse

01

Clean up

Review the 27 stopped deployments, starting with proofs of concept and test projects.

02

Promote

Publish the shared APIs in Exchange as the standard building blocks.

03

Extend

Route new builds through existing shared APIs rather than point-to-point connections.

04

Measure

Re-run this analysis after the clean-up and track the reuse figures.

About this report

Generated from the Anypoint Platform network-graph export of 13 November 2026, covering 4 business groups and 6 environments. Integration flows and reuse come from the production dependency graph seen by Anypoint Visualizer; calls not seen by Visualizer are not included. **Reuse rate** = (consumers − APIs with consumers) ÷ consumers. **Reusability** = APIs with 2+ consumers ÷ APIs with consumers. **Reuse index** = consumers ÷ APIs with consumers. The peer average comes from MuleSoft's ANA industry benchmark data for comparable customers. Data confidence for this export: **High**.
